Thank you for your submission of the team group component of AS1.

What was done well:

The report presents a clear business question and maintains a consistent focus on the relationship between Airbnb prices and distance from Times Square.

The data preparation process is explained clearly, and the creation of the distance feature is relevant to the research question.

The report applies both regression and clustering techniques, demonstrating an understanding of the classical machine learning methods required for the assignment.

Visualisations are used throughout the report to support the analysis and help communicate the key findings.

The discussion recognises that price is influenced by multiple factors and does not rely solely on distance as an explanation.

What could be improved:

The business rationale is quite limited. You should have explained more clearly why this question is important for Airbnb and how the findings could support business decisions.

The methodology lacks some depth. While the modelling approaches are described, there is limited critical discussion of why specific methods were selected and what their limitations are.

The clustering analysis is relatively brief. The identified clusters are described, but there is limited interpretation of how Airbnb could use these segments in practice.

The business impact and recommendations are not developed sufficiently. The report focuses mainly on the technical findings rather than translating them into actionable business insights.

Some conclusions are based on observed relationships, but stronger critical evaluation of the results and model performance would improve the quality of the discussion.

General comments for future work:

This report demonstrates a reasonable understanding of regression and clustering techniques and applies them appropriately to the dataset.

For future work, you should place greater emphasis on explaining the business value of the analysis and linking technical findings to practical recommendations.

You could strengthen the report by providing more critical evaluation of model results, discussing limitations in greater detail, and explaining how the identified clusters could support decision-making.

Overall, the work shows a good effort in applying machine learning techniques, but further analysis, critical discussion, and business interpretation would improve the report.
