Tab 1

Meeting Notes - Team F

Week 1: Assignment Review

- Plan to on track 1 as requested by Nouh in seminar 1.
- Review the Kaggle report on AirBnb, and think of possible themes we'd like to focus on so that we can draw a question from it.

Week 2: Assignment Breakdown

- Assignment was broken down into four chunks, with each chunk being assigned to its owner within the team.
- The possible question themes were brainstormed and discussed within the meeting to narrow down the final question.
- Data preparation will take place following this meeting by Jereon, who will then pass this over to Adaeze and Damiano for cluster and regression model creation/analysis, before sharing with Sarah who will go through the details (do further research on each model) and add more explanation where possible. Sarah will also start the reference list and ensure the structure of the report is cohesive.

Week 3: Model analysis and review

25 08 2026

25 Aug 2026 | Team F Catch up

Attendees: Adaeze Ugochukwu Sarah Woodcock Jeroen Vreijsen Damiano Tartarini

Notes

- Discussed work done so far.
-
- Could remove first regression.
-
- Probably will need to remove some text.
-
- Talk through work done so far.
-
- Jeroen - Introduction.
- Changed question slightly. Added listing segments and location and property characteristics.
-
- Prepared data. Removed listings with zero value. Changed null reviews to zero value.
-
- Added distance from Times Square.
-
- Added map of New York and included a red dot for Times Square.
-
- Assume distance to Times Square has no impact after 10-15km. Shows correlation but not causation. (Sarah: Times Square is central and in the middle of the theatre district and 5th avenue shopping, so our fixed point is representative of all these attractions.)
-
- Damiano.
- Described steps taken and justified these.
- Added in potential references.
-
- Jeroen - properties on Billionaire's row could cause the outliers, so are probably valid. Still makes sense that these properties are in the data. Logarithm reduces impact of outliers. But outliers are probably OK. Outliers shouldn't impact regression.
-
- R2 = 0.15 - very low. Low correlation? 15% of the variance is explained by distance from Times Square.
-
- Multilinear. Identify whether prices are dependent on neighbourhood.
- Polynomial. Separated into training and testing. Is this necessary? Linear, polynomial and multilinear.
-
- All the variables are added to the model and given a weight. That tells us how much impact the different variables have on the price.

- Multi linear approach tells us which part of the data has an impact. Which variables influence the most.
-
- How well the data fits a parabola. R squared is better than the line. Could be due to billionaire properties. The red line is an optimal model. The green fits quite nicely. Price can only go so low.
-
- Train v validation.
- Do we need to split it? Regression is just trying to fit the data. Don't think that train and validation is necessary. Textbook said it's helpful to do this. Use some of the data for training, so that you can see if the rest of the data fits. Not sure if this concept applies to regression.
- Group review of task and definitions of classic machine learning. Agreed that train and validation data is appropriate.
-
- Textbook - Monkey on the cover. Chapter 4 - subsection on regression.
-

Action items

- Adaeze to complete clustering work and message Sarah when done so that I can start on pulling the report together.

- Agreed to meet next Wednesday at 7:30 to confirm final submission if necessary. Sarah to send meeting invitation.
- Sarah to email out final report once complete so that everyone can read and edit at their leisure before Wednesday. If all amendments are agreed before then, then it can be submitted prior to the meeting.

02 09 2026

2 Sept 2026 | Team F Catch up

Attendees: Damiano Tartarini Jeroen Vreijsen Sarah Woodcock

Notes

- Discussed whether report answered question - Yes.
- Read through entire report. Made some small edits to improve clarity and readability.
-
- Agreed Sarah will update formatting and text to "tidy up" and remove odd marks left by editing.
-
- Sarah will find some recent papers as references for some of the clustering items. (re-checking word count)
-
- Sarah will re-format the images so that the image captions are included in the images - thereby not affecting the word count.
-
- Sarah will email the final Word doc to all team members on Thursday evening (3rd September) and, at the same time, submit it to TurnItIn for checking.
-
- Team members will be given a short deadline (TBC) to review the text and confirm they're happy with it.
-
- It will then be submitted by Sarah.
-
-
-

Action items

- All team members - review and confirm acceptance of final report as soon as possible after it’s sent out.
- All Team members - do not forget to also fill in and submit peer reviews - as this also counts towards the final mark.
